## FontBook

Keep track of your fonts. FontBook shows all fonts installed in the system and, under Mac OS X, also prints catalogs of fonts that are not installed for which you can choose from 27 design templates.

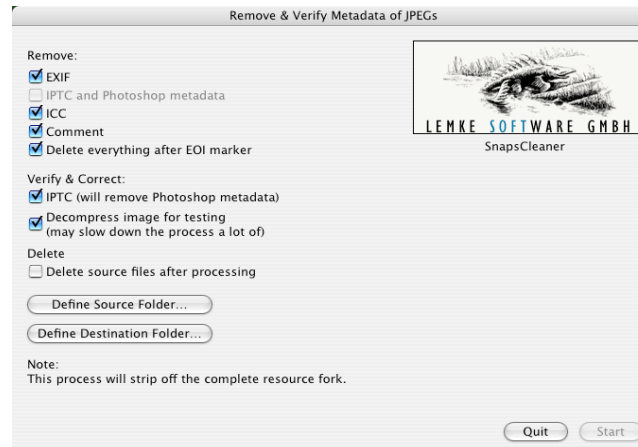

FontBook allows you to display the key combinations that you can use to enter special characters like, for example, the copyright symbol © (Option-G).

FontBook is shareware. Simply download and test FontBook. Registration costs just $10 (USD).

SnapsCleaner

SnapsCleaner allows you to check JPG image files and remove any unnecessary meta data.

It is useful to check the meta data since many tools that write meta data in JPEG documents do not observe the standards and sometimes also add information to the documents that you do not want to pass on (e.g. the location of the document on your system). Furthermore incorrect meta data can cause your customers' picture databases to crash making you liable.

SnapsCleaner is controlled completely via the main dialog and requires a Macintosh with System 9 or above. SnapsCleaner is shareware. Registration costs $ 30 (USD).

GraphicConverter

CADintosh

FontBook

SnapsCleaner

GraphicConverter

To begin with, GraphicConverter was a program for converting pictures to other formats. After many years of development, GraphicConverter has become a fully-functioned image processing application which you can use to import images from a scanner or digital camera, manage them, edit them and export them.

It does not end at easy printing using layout pages or catalog printing. GraphicConverter can also be used to output HTML pages with a wide range of options to customize the design to suit your own taste.

Of course, your images are automatically sharpened and any profiles are added to the file. Everything is professional so that your pictures turn out perfect.

Just give GraphicConverter a try. Drag a folder containing pictures onto the program icon and a browser window will open. Edit or sort images with a few mouse clicks without having to worry about losing any data or not being able to find files on your hard drive because GraphicConverter works exclusively on a file basis.
You can index your pictures with IPTC keywords. Are you looking for pictures of a church? Simply enter "church" as a search term in the browser search box.
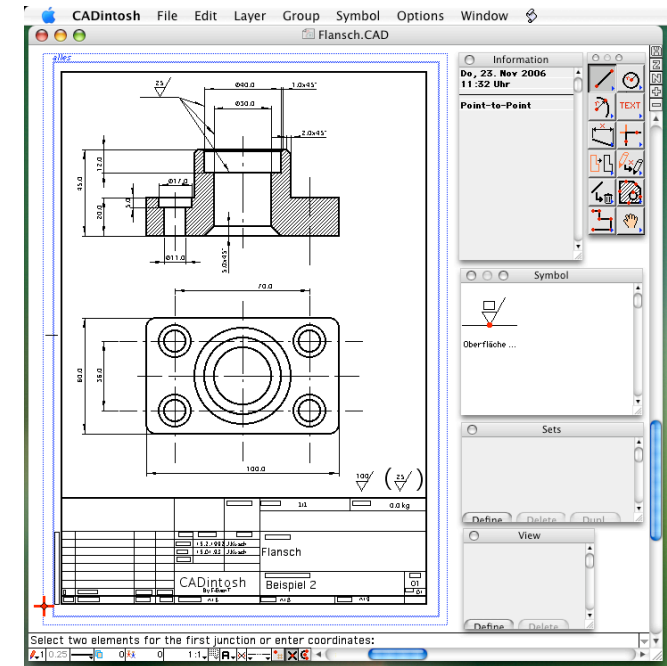

GraphicConverter shows the corresponding images in a browser window using a spotlight. And, you can move your image files at anytime unlike database-based programs.

Download GraphicConverter and test it without any obligations. After all, registration is not expensive at $30 (USD).

Ideal for fast image processing: the **operator** at the top of open pictures allows fast access to the most important settings from brightness to gamma.

CADintosh

Do you want to build a house or make a 2D technical drawing? Then CADintosh is the right program for you.

For example, you can continue drawing a page and open any number of sub-windows of a drawing, which are automatically updated.

In addition to eight pens, you can use different types of lines up to 99.99 mm. Options like line, circle, measurement, hatching, X-lines etc. make your work easier and the import and export of DXF, HPGL, IGES and PICT allow you to communicate with the outside world without complications.

32000 groups and 1024 layers: not convinced yet? The registered version allows complex layer management (names for layer sets, helper windows) and icon libraries for importing and exporting icons. And, if you want to take a break, CADintosh saves all settings for each drawing separately. But the best is yet to come: The automatic catch mode brings magnetism into play. Simply download and test CADintosh. You will be amazed by the number of possibilities you get for just $32 (USD).
